carbonate, and phosphorus are the main ingredients of many fertilizers. The research is applied to identify potential sources of phosphorus and carbon in the environment. The research also helps to optimize agricultural practices to reduce the use of fertilizers and preserve natural resources. The research is a joint effort of the University of Georgia and the University of Tennessee, with funding from the National Science Foundation.

Environmental Protection Agency (EPA)

The EPA is focused on research to address environmental issues such as air pollution, climate change, and water quality. The agency conducts research in collaboration with universities, government agencies, and private sector organizations. The agency provides funding for research projects through grants, cooperative agreements, and interagency agreements. The research aims to improve understanding of environmental processes, develop new technologies, and inform policy decisions. Examples of EPA-funded research include studies on carbon sequestration in forests, air pollution in urban areas, and water quality in rivers.

Funding Source:

National Science Foundation (NSF)

The NSF is a federal agency that provides funding for research and education in the fields of science and engineering. The agency supports a wide range of research projects, including those in environmental science. The NSF provides funding through grants and cooperative agreements, and the research is conducted by universities, government agencies, and private sector organizations. The research aims to advance knowledge in environmental science, develop new technologies, and inform policy decisions. Examples of NSF-funded research include studies on climate change, biodiversity, and water quality.
