The Global Symposium on Soil Biodiversity can provide an opportunity for policy makers, food producers, scientists, practitioners and other professionals to come together and discuss the importance of soil biodiversity and its role in sustaining life. The symposium will be held in June 2020 and will focus on the latest research and developments in the field of soil biodiversity. The symposium will bring together researchers, practitioners, and stakeholders from around the world to share their knowledge and experiences in order to advance our understanding of the importance of soil biodiversity and its role in sustaining life.

Integral to achieving these goals is a fundamental understanding of the transport and fate of substances in the environment. The Environmental Engineering Program at George Mason University offers a range of program areas such as Advanced Scientific Computing Research, Basic Energy Sciences, and Chemical, Bioengineering, Environmental, and Energy Convergence Opportunities in the (ECO-CBET) division. These program areas aim to provide students with a comprehensive understanding of the environmental issues and challenges faced today.

Projects should be compelling and reflect sustained, coordinated efforts from interdisciplinary teams. The (ECO-CBET) division aims to encourage interdisciplinary collaboration in order to develop innovative solutions to environmental problems. The division will provide funding opportunities for projects that integrate over levels of biological organization or across multiple spatial and temporal scales.

The Office of Science of the US Department of Energy is offering a 10-week paid professional training experience with a focus on sustainable water management. The training will take place at the National Institute for Water Resources (NIWR) in Washington, DC.
