March 6th, 2020
6:00pm - 7:15pm
Johnson Center Cinema, Mason Fairfax Campus

The conference theme challenges us to rethink the role of education in the era of dynamic global environments with a 2-degree Celsius rise in average global temperature? How about a 4-degree rise? How do we prepare our students for these changes? How can we integrate over levels of biological organization or across multiple spatial and temporal scales?

Environmental Biology

The Division of Environmental Biology (DEB) encourages and supports the research of DEB investigators and has established two new Core Tracks: Core Track 1 focuses on understanding the core processes that determine global climate change and biodiversity, while Core Track 2 focuses on understanding the core processes that determine human health, including public health, infectious disease, and nutrition. A 2-degree Celsius rise in average global temperature will affect us all. Climate change is a pressing issue that affects us all. The conference will provide an opportunity for scientists and policy-makers to share ideas and experiences, and to identify opportunities for collaboration and action. The conference will also study how new technologies can be used to address the challenges posed by climate change and biodiversity loss.

The conference will be held on March 6th, 2020, from 6:00pm to 7:15pm at the Johnson Center Cinema on the Fairfax Campus. The conference is free and open to all.

Please mark your calendars and plan to attend!
