The Institute for a Sustainable Earth (ISE) is an interdisciplinary organization that aims to facilitate information sharing among researchers, practitioners, and relevant local, national, and international organizations. The main objective of ISE is to address critical knowledge gaps and promote the development of practical solutions to achieve a sustainable future.

The Symposium will convene key stakeholders to explore the skills, knowledge and attitudes required to facilitate the transition from capacity development to implementation science. This symposium is supported by the African Development Bank, UN Habitat and other development partners and is preparing the 6th Global Soil Biodiversity Initiative (GSBI) Symposium, which will be held at the Food and Agriculture Organization (FAO) at its Headquarters in Rome, Italy on March 10-12, 2020.

The Environmental Engineering Program aims to connect members of the Mason community with policy leaders throughout the Washington, DC network. This program provides opportunities for students to interact with policy leaders and engage in real-world projects that address sustainability challenges. The program offers fellowships and research opportunities for graduate students and offers a range of degree programs in environmental engineering.

The (ECO-CBET) at the University of Colorado Boulder has three positions available for new graduate student Fellows, beginning August 2020. These positions are designed to support the development of new food system technologies, with a focus on cellular agriculture, which involves the use of biotechnology to create new food products.

The National Oceanic & Atmospheric Administration (NOAA) Marine Debris Program (MDP) is providing funding for research in the following areas: marine debris, ocean acidification, and climate change. This program offers two-year fellowships to support research that applies scientific and engineering principles to address marine debris problems.

The James Smithson Fellowship Program at the Smithsonian Institution offers post-doctoral research opportunities for early career scientists. This program is designed to support research that advances the understanding of the complex systems that govern the behavior of the planet, including the interactions between humans and the natural world.

The U.S. Department of Agriculture (USDA) Solid Waste Management Grant Program offers funding opportunities for research in the area of solid waste management. This program supports research that investigates and prevents the adverse impacts of marine debris, and leads national efforts to address marine debris. The mission of the NOAA MDP is to investigate and prevent the adverse impacts of marine debris. This mission is achieved through the collection and analysis of data on marine debris, and through the development and implementation of strategies to address marine debris.

The Long-Term Ecological Research Program (LTER) is a network of long-term ecological research sites that study the interactions between ecosystems and the human societies that depend on them. This program offers funding opportunities for research that investigates the impacts of climate change on ecosystems, and the ways in which humans adapt to these changes.
