UC Path is the new human resources system for UC. Many major improvements have been made in the latest release. A number of new features were added to improve the overall user experience. One of the key improvements is the ability to view and edit pay rates. This change allows users to easily update pay rates for their employees.

In addition, the system now supports multi-location appointments. This feature enables users to schedule appointments for multiple locations at the same time. This is especially useful for agencies that operate in multiple locations and need to manage appointments across multiple sites.

Another important change is the improved support for reporting and analytics. The system now supports more advanced reporting options, allowing users to generate more detailed reports and gain deeper insights into their data. This is particularly useful for agencies that need to monitor performance metrics and track progress over time.

Finally, the system now includes enhanced security features. This includes improved access control, user authentication, and data encryption. These changes help ensure the security of sensitive data and provide users with peace of mind.

We are excited to see how these improvements will benefit our users. Stay tuned for more updates in the future!
